PROBLEM STATEMENT

Clinkit is running into a major snag on the customer end. People are trying to order and pay, but the system keeps failing at checkout. This is causing a flood of customer complaints and directly hurting our revenue and reputation.

Main problems:

- Checkout Friction
- Inverted Demand & Inventory
- Data Security & Privacy

SOLUTIONS

Fix Checkout & Auto-Failover

Implement backup payment gateways immediately so transactions process seamlessly even if the primary system drops.

Protect Customer Data

Enforce end-to-end encryption and sanitize error logs to guarantee sensitive user details remain completely secure during fixes.

Balance Inventory & Demand

Update search algorithms to highlight high-value products

Proactive Customer Communication

Deploy instant support updates and real-time order tracking to reassure affected buyers and rebuild platform trust.

Outage Recovery

Revenue Impact

The August outage caused \$34.5K in lost revenue and trapped 3,465 carts/units, creating phantom inventory holds and artificial demand signals.

Immediate Operational Need

15 critical SKUs fall below safety limits and require immediate emergency restocking to restore core availability.

Systemic Fix

Implementing the recommended +16.8 units/SKU reorder point (ROP) uplift will establish a safe buffer against future outage-induced demand spikes.

THANK YOU
